

Introduction to Machine Learning

Machine learning is a subfield of artificial intelligence (AI).

The goal of machine learning generally is to understand the structure of data and fit that data into models that can be understood and utilized by people.

Neural Networks are a series of algorithms that endeavor to recognize underlying relationships in a set of data through a process that mimics the way the human brain operates.

Backpropagation is the essence of neural net training. It is the method of fine-tuning the weights of a neural net based on the error rate obtained in the previous epoch.

Vector Embeddings are high-dimensional mathematical representations used for semantic similarity.
